Inverse Problems in Analysis and Geometry  
Isaac Newton Institute, Cambridge  
1-5 August 2011

## The basic problem

Consider a body  $\Omega \subset \mathbb{R}^3$  which might contain an unknown, inaccessible, crack represented by  $\Sigma \subset\subset \Omega$ , a two-dimensional orientable surface with boundary . We wish to recover  $\Sigma$  from electrostatic measurements taken on  $\partial\Omega$ .

# The basic problem

## Perfectly insulating crack

**The direct problem.** Given  $\Sigma$  and given  $\psi$  on  $\partial\Omega$  such that  $\int_{\partial\Omega} \psi = 0$ , find  $u$  such that

$$\begin{cases} \Delta u = 0, & \text{in } \Omega \setminus \Sigma, \\ \nabla u \cdot \nu^\pm = 0, & \text{on either side of } \Sigma, \\ \nabla u \cdot \nu = \psi, & \text{on } \partial\Omega. \end{cases}$$

**The inverse problem.** Find  $\Sigma$  given  $u_k|_{\partial\Omega}$ ,  $k = 1, \dots, K$ , with the potentials  $u_k$  corresponding to *suitable* finitely many choices of  $\psi = \psi_1, \dots, \psi_K$ .

# The basic problem

## Perfectly insulating crack

**The direct problem.** Given  $\Sigma$  and given  $\psi$  on  $\partial\Omega$  such that  $\int_{\partial\Omega} \psi = 0$ , find  $u$  such that

$$\begin{cases} \Delta u = 0, & \text{in } \Omega \setminus \Sigma, \\ \nabla u \cdot \nu^\pm = 0, & \text{on either side of } \Sigma, \\ \nabla u \cdot \nu = \psi, & \text{on } \partial\Omega. \end{cases}$$

**The inverse problem.** Find  $\Sigma$  given  $u_k|_{\partial\Omega}$ ,  $k = 1, \dots, K$ , with the potentials  $u_k$  corresponding to *suitable* finitely many choices of  $\psi = \psi_1, \dots, \psi_K$ .

here  $\nu^+, \nu^-$  are the unit outward normal vectors on the two sides of  $\Sigma$  and  $\gamma^+, \gamma^-$  are nonnegative functions.

## Further variants

**2D model.**  $\Omega \subset \mathbb{R}^2$ ,  $\Sigma$  simple arc.

**Multiple cracks.**  $\Sigma$  disjoint union of finitely many cracks  $\Sigma_j$ .

**Full boundary data.**

$$N_{\Sigma} : \nabla u \cdot \nu|_{\partial\Omega} \rightarrow u|_{\partial\Omega} .$$

or otherwise

$$\Lambda_{\Sigma} : u|_{\partial\Omega} \rightarrow \nabla u \cdot \nu|_{\partial\Omega} .$$

**Inhomogeneous (known) background.** Replace  $\Delta$  with, for instance,  $\operatorname{div}(\gamma \nabla \cdot)$ ,  $\gamma = \gamma(x) > 0$  known.

## Stability

A. '93. A.-Rondi '99, Rondi '99, Rondi '05.

Under a-priori regularity (Lipschitz) assumptions on the unknown (multiple) crack the mapping

data  $\rightarrow$  crack

is continuous with a **logarithmic** modulus of continuity.

Di Cristo-Rondi '03.

Logarithmic continuity is **optimal** also with full boundary data.

## A relaxed question.

In order to prove uniqueness for an insulating crack it would be sufficient to prove that we can find current densities  $\psi_1, \psi_2, \psi_3$  such that, for any  $\Sigma$  and for any regular surface  $S \subset \Omega \setminus \Sigma$  there exists one potential  $u_j$ , corresponding to the current density  $\psi_j$ , such that  $\nabla u_j \cdot \nu$  does not identically vanish on  $S$ .

## A relaxed question.

## Problem

Let  $U = (u_1, u_2, u_3)$  be the map whose components solve

$$\begin{cases} \Delta u_j = 0, & \text{in } \Omega \setminus \Sigma, \\ \nabla u_j \cdot \nu^\pm = 0, & \text{on either side of } \Sigma, \\ \nabla u_j \cdot \nu = \psi_j, & \text{on } \partial\Omega. \end{cases}$$

To find  $\psi_1, \psi_2, \psi_3$  such that, for any  $\Sigma$ , the set

$$S = \{x \in \Omega \setminus \Sigma \mid \det DU(x) = 0, (DU \nabla \det DU)(x) = 0\}$$

has at most dimension 1.
