Palinuro May 2015, 25–29

# Introduction

Since the '80s, a dominant theme in Inverse Problems has been:

To image the interior of an object from measurements taken in its exterior.

Consider the (direct) elliptic Dirichlet problem of finding a weak solution  $u$  to

$$\begin{cases} \operatorname{div}(\sigma \nabla u) = 0 & \text{in } \Omega, \\ u = \varphi & \text{on } \partial\Omega, \end{cases}$$

where  $\Omega$  is a bounded connected open set in  $\mathbb{R}^n$ ,  $n \geq 2$ , and  $\sigma = \{\sigma_{ij}(x)\}$  satisfies uniform ellipticity

$$\begin{aligned} \sigma(x)\xi \cdot \xi &\geq K^{-1}|\xi|^2, & \text{for every } x, \xi \in \mathbb{R}^2, \\ \sigma^{-1}(x)\xi \cdot \xi &\geq K^{-1}|\xi|^2, & \text{for every } x, \xi \in \mathbb{R}^2. \end{aligned}$$

## Introduction

To image the interior of an object from measurements taken in its exterior.

Consider the (direct) elliptic Dirichlet problem of finding a weak solution  $u$  to

$$\begin{cases} \operatorname{div}(\sigma \nabla u) = 0 & \text{in } \Omega, \\ u = \varphi & \text{on } \partial\Omega, \end{cases}$$

where  $\Omega$  is a bounded connected open set in  $\mathbb{R}^n$ ,  $n \geq 2$ , and  $\sigma = \{\sigma_{ij}(x)\}$  satisfies uniform ellipticity

$$\begin{aligned} \sigma(x)\xi \cdot \xi &\geq K^{-1}|\xi|^2, & \text{for every } x, \xi \in \mathbb{R}^2, \\ \sigma^{-1}(x)\xi \cdot \xi &\geq K^{-1}|\xi|^2, & \text{for every } x, \xi \in \mathbb{R}^2. \end{aligned}$$

# Introduction

The *Calderón's inverse problem* (EIT) is:  
Find  $\sigma$ , given all pairs of Cauchy data

$$(u|_{\partial\Omega}, \sigma \nabla u \cdot \nu|_{\partial\Omega}) .$$

. Main problems:

- If  $\sigma = \{\sigma_{ij}(x)\}$ , nonuniqueness (Tartar '84).
- If  $\sigma = \{\gamma(x)\delta_{ij}\}$ , instability (Mandache '01).

# Introduction

The *Calderón's inverse problem* (EIT) is:

- If  $\sigma = \{\gamma(x)\delta_{ij}\}$ , instability (Mandache '01).

# Introduction

Coupled physics: to combine electrical measurements with other physical modalities.

- EIT + Magnetic Resonance (MREIT): interior values of  $|\sigma \nabla u|$  (Kim, Kwon, Seo, Yoon '02).
- EIT + Ultrasonic waves (UMEIT): by focusing ultrasonic waves on a tiny spot near  $x \in \Omega$  and by applying various boundary potentials  $\varphi_i$  it is possible to detect the local energies  $H_{ij} = \sigma \nabla u_i \cdot \nabla u_j(x)$  (Ammari et al. '08).

# The problem

Monard and Bal '12, '13: reconstruction of  $\sigma$  from  $\{H_{ij}\}$ , provided  $U = (u_1, \dots, u_n)$  is a  $\sigma$ -harmonic mapping (i.e.: a  $n$ -tuple of solutions) such that

$$\det DU > 0, \text{ in } \Omega .$$

## Question:

Can we find  $\Phi = (\varphi_1, \dots, \varphi_n)$ , independent of  $\sigma$ , such that  $\det DU > 0$  everywhere?

# The problem

Monard and Bal '12, '13: reconstruction of  $\sigma$  from  $\{H_{ij}\}$ , provided  $U = (u_1, \dots, u_n)$  is a  $\sigma$ -harmonic mapping (i.e.: a  $n$ -tuple of solutions) such that

$$\det DU > 0, \text{ in } \Omega .$$

## Question:

Can we find  $\Phi = (\varphi_1, \dots, \varphi_n)$ , independent of  $\sigma$ , such that  $\det DU > 0$  everywhere?

# The problem

$$\det DU > 0, \text{ in } \Omega .$$

## Question:

Can we find  $\Phi = (\varphi_1, \dots, \varphi_n)$ , **independent of  $\sigma$** , such that  $\det DU > 0$  everywhere?

## $n = 2$ . The Classical Results

Let  $\Omega \subset \mathbb{R}^2$  be a Jordan domain and let

$$\Phi = (\varphi_1, \varphi_2) : \partial\Omega \rightarrow \partial G,$$

be a homeomorphism. Consider

$$\begin{cases} \Delta U = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

### Theorem ( H. Kneser '26)

If  $G$  is convex, then  $U$  is a **homeomorphism** of  $\bar{\Omega}$  onto  $\bar{G}$ .

Posed as a problem by Radó ('26), rediscovered by Choquet ('45).

### Theorem (H. Lewy '36)

If  $U : \Omega \rightarrow \mathbb{R}^2$  is a harmonic **homeomorphism**, then it is a **diffeomorphism**.

## $n = 2$ . The Classical Results

Let  $\Omega \subset \mathbb{R}^2$  be a Jordan domain and let

$$\Phi = (\varphi_1, \varphi_2) : \partial\Omega \rightarrow \partial G,$$

be a homeomorphism. Consider

$$\begin{cases} \Delta U = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

### Theorem ( H. Kneser '26)

If  $G$  is convex, then  $U$  is a **homeomorphism** of  $\overline{\Omega}$  onto  $\overline{G}$ .

Posed as a problem by Radó ('26), rediscovered by Choquet ('45).

### Theorem (H. Lewy '36)

If  $U : \Omega \rightarrow \mathbb{R}^2$  is a harmonic **homeomorphism**, then it is a **diffeomorphism**.

## $n = 2$ . The Classical Results

Let  $\Omega \subset \mathbb{R}^2$  be a Jordan domain and let

$$\Phi = (\varphi_1, \varphi_2) : \partial\Omega \rightarrow \partial G,$$

be a homeomorphism. Consider

$$\begin{cases} \Delta U = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

### Theorem ( H. Kneser '26)

If  $G$  is convex, then  $U$  is a **homeomorphism** of  $\overline{\Omega}$  onto  $\overline{G}$ .

Posed as a problem by Radó ('26), rediscovered by Choquet ('45).

### Theorem (H. Lewy '36)

If  $U : \Omega \rightarrow \mathbb{R}^2$  is a harmonic **homeomorphism**, then it is a **diffeomorphism**.

$n = 2$ . Variable coefficients.

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

Let

$$\Phi : \partial\Omega \rightarrow \partial G,$$

be a homeomorphism, and let  $G$  be convex.

### Theorem (Bauman-Marini-Nesi '01)

*Assume  $\Omega, G$  be  $C^{1,\alpha}$ -smooth,  $\sigma \in C^\alpha$  and  $\Phi$  a  $C^{1,\alpha}$  diffeomorphism.*

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

*then  $U : \bar{\Omega} \rightarrow \bar{G}$  is a diffeomorphism.*

# $n = 2$ . Variable, nonsmooth, coefficients.

## Theorem (A.-Nesi '01)

*If we only assume  $\sigma \in L^\infty$ , then  $U$  is a **homeomorphism** of  $\overline{\Omega}$  onto  $\overline{G}$ .*

## Theorem (A., Nesi '01)

*If  $U : \Omega \rightarrow \mathbb{R}^2$  is a  $\sigma$ -harmonic homeomorphism, then*

$$|\det DU| > 0 \text{ a.e. .}$$

*In fact,  $|\det DU|$  is a Muckenhoupt weight (A., Nesi '09) .*

# $n = 2$ . Variable, nonsmooth, coefficients.

## Theorem (A.-Nesi '01)

If we only assume  $\sigma \in L^\infty$ , then  $U$  is a *homeomorphism* of  $\overline{\Omega}$  onto  $\overline{G}$ .

## Theorem (A., Nesi '01)

If  $U : \Omega \rightarrow \mathbb{R}^2$  is a  $\sigma$ -harmonic homeomorphism, then

$$|\det DU| > 0 \text{ a.e. .}$$

In fact,  $|\det DU|$  is a Muckenhoupt weight (A., Nesi '09) .

## An example

Meyers ('63). Fix  $\alpha > 0$

$$\sigma(x) = \begin{pmatrix} \frac{\alpha^{-1}x_1^2 + \alpha x_2^2}{x_1^2 + x_2^2} & \frac{(\alpha^{-1} - \alpha)x_1 x_2}{x_1^2 + x_2^2} \\ \frac{(\alpha^{-1} - \alpha)x_1 x_2}{x_1^2 + x_2^2} & \frac{\alpha x_1^2 + \alpha^{-1}x_2^2}{x_1^2 + x_2^2} \end{pmatrix}.$$

$\sigma$  has eigenvalues  $\alpha$  and  $\alpha^{-1}$ . Therefore  $\sigma$  satisfies uniform ellipticity.  $\sigma$  is discontinuous at  $(0, 0)$  (and only at  $(0, 0)$ ) when  $\alpha \neq 1$ . Denote

$$\begin{aligned} u_1(x) &= |x|^{\alpha-1} x_1, \\ u_2(x) &= |x|^{\alpha-1} x_2. \end{aligned}$$

A direct calculation shows that  $U = (u_1, u_2)$  is  $\sigma$ -harmonic. We compute

$$\det DU = \alpha |x|^{2(\alpha-1)}.$$

Therefore  $\det DU$  vanishes at  $(0, 0)$  when  $\alpha > 1$ , when  $\alpha \in (0, 1)$ , it diverges as  $z \rightarrow 0$ .

## n=2. Proof sketch

## Definition

A function  $\varphi \in C(\partial\Omega; \mathbb{R})$  is called **unimodal** if  $\partial\Omega$  can be split into two arcs  $\Gamma_1, \Gamma_2$  such that  $\varphi$  is non-decreasing on  $\Gamma_1$  and non-increasing on  $\Gamma_2$ .

$$\begin{cases} \operatorname{div}(\sigma \nabla u) = 0 & \text{in } \Omega, \\ u = \varphi & \text{on } \partial\Omega, \end{cases}$$

## Lemma

*If  $\varphi$  is unimodal, then the level lines of  $u$  are formed by simple arcs.*

Hence (in the smooth case)  $|\nabla u| > 0$  everywhere in  $\Omega$ .

## Definition

A function  $\varphi \in C(\partial\Omega; \mathbb{R})$  is called **unimodal** if  $\partial\Omega$  can be split into two arcs  $\Gamma_1, \Gamma_2$  such that  $\varphi$  is non-decreasing on  $\Gamma_1$  and non-increasing on  $\Gamma_2$ .

$$\begin{cases} \operatorname{div}(\sigma \nabla u) = 0 & \text{in } \Omega, \\ u = \varphi & \text{on } \partial\Omega, \end{cases}$$

## Lemma

*If  $\varphi$  is unimodal, then the level lines of  $u$  are formed by simple arcs.*

Hence (in the smooth case)  $|\nabla u| > 0$  everywhere in  $\Omega$ .

## n=2. Proof sketch

## Lemma

*If*

$$\Phi : \partial\Omega \rightarrow \partial G, \quad G \text{ convex},$$

*is a homeomorphism, then  $\varphi = \Phi \cdot \xi$  is unimodal for all  $\xi$ ,  $|\xi| = 1$ .*

Hence

$$DU^T DU \xi \cdot \xi = |DU \xi|^2 = |\nabla(U \cdot \xi)|^2 > 0$$

everywhere and for all  $\xi$ ,  $|\xi| = 1$ . Therefore,  $DU$  is nonsingular everywhere.

## $n=2$ . Quantitative assumptions

Let  $\omega : [0, \infty) \rightarrow [0, \infty)$  be a continuous strictly increasing function such that  $\omega(0) = 0$ .

### Definition

Given  $m, M \in \mathbb{R}$ ,  $m < M$ , Given  $\varphi \in C^{1,\alpha}(\partial\Omega; \mathbb{R})$  we shall say that it is **quantitatively unimodal**, if considering the arclength parametrization of  $\partial\Omega$ ,  $x = x(s)$ ,  $0 \leq s \leq T = |\partial\Omega|$ , the periodic extension of the function  $[0, T] \ni s \rightarrow \varphi(s) \equiv \varphi(x(s))$  is such that there exists numbers  $t_1 \leq t_2 < t_3 \leq t_4 < t_1 + T$  such that

$$\begin{aligned} \varphi(s) &= m, s \in [t_1, t_2], \quad \varphi(s) = M, s \in [t_3, t_4], \\ \varphi'(s) &\geq \min\{\omega(s - t_2), \omega(t_3 - s)\}, s \in [t_2, t_3], \\ -\varphi'(s) &\geq \min\{\omega(s - t_4), \omega(t_1 + T - s)\}, s \in [t_4, t_1 + T]. \end{aligned}$$

We will refer to the quadruple  $\{T, m, M, \omega\}$  as to the “character of unimodality” of  $\varphi$ .

## $n=2$ . Quantitative assumptions

If  $\partial G$  is  $C^2$  with positive curvature, then quantitatively convex mappings  $\Phi : \partial\Omega \rightarrow \partial G$  are easily constructed.

## $n=2$ . Quantitative bound

### Theorem (A., Nesi '15)

Let  $\Omega$  have  $C^{1,\alpha}$  boundary, let  $\sigma$  be uniformly elliptic and  $C^\alpha$ . Let  $\Phi = (\varphi_1, \varphi_2) : \partial\Omega \rightarrow \partial G$  be a  $C^{1,\alpha}$  quantitatively convex map with character  $\{|\partial\Omega|, D, \omega\}$ . Let  $U = (u_1, u_2)$  solve

$$\begin{cases} \operatorname{div}(\sigma \nabla u_i) = 0 & \text{in } \Omega, \\ u_i = \varphi_i & \text{on } \partial\Omega. \end{cases}$$

Then there exists  $C > 0$ , only depending on ellipticity, on the regularity assumptions and on the character of convexity of  $\Phi$  such that

$$\det DU \geq C > 0 \quad \text{in } \bar{\Omega}.$$

## $n=2$ . Proof sketch

It suffices to obtain a lower bound on  $|\nabla u|$  where  $u = (U \cdot \xi)$ , uniformly w.r.t.  $\xi$ ,  $|\xi| = 1$ .

Near the boundary we can use the quantitative unimodality and a Hopf-type lemma (Finn-Gilbarg '57).

In the interior we use the theory of Q.C. mappings. Using complex notation  $z = x_1 + ix_2$ ,  $u = \Re e f$ ,

$$f_{\bar{z}} = \mu f_z + \nu \bar{f}_z \quad \text{in } \Omega,$$

where, the so called complex dilatations  $\mu, \nu$  only depend on  $\sigma$  and satisfy the ellipticity condition

$$|\mu| + |\nu| \leq k < 1,$$

## $n=2$ . Proof sketch

$$|\mu| + |\nu| \leq k < 1,$$

$$f_{\bar{z}} = \mu f_z + \nu \bar{f}_z \quad \text{in } \Omega ,$$

Here, being  $\sigma$  Hölder continuous, also  $\mu$  and  $\nu$  satisfy a Hölder bound.

Let us denote  $g = f^{-1}(w)$ ,  $w \in \mathbb{C}$ . A straightforward calculation gives

$$g_{\bar{w}} = -\nu(g)g_w - \mu(g)\overline{g_w}.$$

By interior regularity estimates,  $g_w$  is locally bounded.

$$\det Df^{-1} = \det Dg = |g_w|^2 - |g_{\bar{w}}|^2 \leq C^2 ,$$

which can be rewritten as

$$\sigma \nabla u \cdot \nabla u = \det Df \geq C^{-2} ,$$

at any fixed distance from the boundary.

Consider  $\Omega \subset \mathbb{R}^n$ , a bounded domain diffeomorphic to a ball of class  $C^{1,\alpha}$ . Let  $\sigma$  satisfy uniform ellipticity and Hölder continuity.

Let  $G \subset \mathbb{R}^n$  be a convex body with  $C^2$  boundary and having at each point principal curvatures bounded from below by  $\kappa > 0$ .

Let  $\Phi : \partial\Omega \rightarrow \partial G$  be an orientation preserving diffeomorphism such that  $\Phi, \Phi^{-1}$  are  $C^{1,\alpha}$ . Let  $U$  be the weak solution to

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0 & \text{in } \Omega, \\ U = \Phi & \text{on } \Omega, \end{cases}$$

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0 & \text{in } \Omega, \\ U = \Phi & \text{on } \Omega, \end{cases}$$

Denote  $\Omega_\rho = \{x \in \Omega \mid \operatorname{dist}(x, \partial\Omega) > \rho\}$ .

### Theorem (A., Nesi '15)

*There exists  $\rho > 0$  and  $Q > 0$  such that  $U$  is a diffeomorphism of  $\overline{\Omega} \setminus \Omega_\rho$  onto a neighborhood of  $\partial G$ , within  $\overline{G}$  and we have*

$$\det DU \geq Q \quad \text{in } \overline{\Omega} \setminus \Omega_\rho.$$

## Examples

Wood '91:

$$U(x_1, x_2, x_3) = (x_1^3 - 3x_1x_3^2 + x_2x_3, x_2 - 3x_1x_3, x_3)$$

$U$  is a homeomorphism, but  $\det DU = 0$  on the plane  $\{x_1 = 0\}$ .

Laugesen '96:

$\forall \varepsilon > 0 \exists \Phi : \partial B \mapsto \partial B$  homeomorphism, such that  $|\Phi(x) - x| < \varepsilon, \forall x \in \partial B$  and the solution  $U = (u_1, u_2, u_3)$  to

$$\begin{cases} \Delta U = 0, & \text{in } B, \\ U = \Phi, & \text{on } \partial B. \end{cases}$$

is **not** one-to-one.

is **not** one-to-one.

Briane, Milton, Nesi '04:

Set  $Q = [0, 1]^3 \subset \mathbb{R}^3$ , assume  $\sigma$   $Q$ -periodic and consider the *cell* problem

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0, & \text{in } \mathbb{R}^3, \\ (U - x) \text{ } Q\text{-periodic} & . \end{cases}$$

There exists an isotropic matrix  $\sigma = \gamma I$ , with  $\gamma$  taking only two values, with a smooth interface, such that  $\det DU$  **changes its sign** in the interior of the cube  $Q$  of periodicity.

There exists an isotropic matrix  $\sigma = \gamma I$ , with  $\gamma$  taking only two values, with a smooth interface, such that  $\det DU$  **changes its sign** in the interior of the cube  $Q$  of periodicity.

Capdeboscq, March 2015! (elaborating on the  
Briane-Milton-Nesi example):

Consider

$$\begin{cases} \Delta H = 0, & \text{in } \Omega \subset \mathbb{R}^3, \\ H = \Phi, & \text{on } \partial\Omega. \end{cases}$$

For any  $\Phi$  such that  $\det DH > 0$  everywhere in  $\Omega$ ,  
there exist  $\sigma \in C^\infty$  and isotropic such that, considering

$$\begin{cases} \operatorname{div}(\sigma \nabla U) = 0, & \text{in } \Omega, \\ U = \Phi, & \text{on } \partial\Omega. \end{cases}$$

$\det DU$  changes its sign in the interior of  $\Omega$ .

$\det DU$  **changes its sign** in the interior of  $\Omega$ .

**Open Problem:** To control, in terms of the Dirichlet data, the size (or the dimension) of the set of points where the Jacobian may degenerate and possibly evaluate the vanishing rate at such points of degeneration.

Han and Lin, 2000: Let  $\sigma \in C^\infty$ . If  $U$  is nonconstant, then, locally, the set

$$\{\text{rank } DU = 0\}$$

has finite  $n - 2$ -dimensional Hausdorff measure.

If  $U$  is nonconstant, and  $U(\Omega)$  is not contained in a straight line, then, locally, the set

$$\{\text{rank } DU = 1\}$$

has finite  $n - 1$ -dimensional Hausdorff measure.

Jin and Kazdan '91:

$\exists \sigma \in C^\infty$  and a solution  $U = (u_1, u_2, u_3)$  to

$$\operatorname{div}(\sigma \nabla U) = 0 \text{ in } \mathbb{R}^3,$$

such that

$$\begin{cases} \operatorname{rank} DU = 2, & \text{for } x_3 \leq 0, \\ \det DU > 0, & \text{for } x_3 > 0. \end{cases}$$

Let  $a \in C^\infty(\mathbb{R}; \mathbb{R})$  and set

$$\sigma(x) = \begin{pmatrix} 1 & a(x_3) & 0 \\ a(x_3) & 1 & 0 \\ 0 & 0 & b(x_3) \end{pmatrix},$$

with

$$\begin{cases} a(x_3) = 0 & \text{for } x_3 \leq 0, \\ a(x_3) \in (0, a_0) & \text{for } x_3 > 0 \\ b(x_3) = \frac{1}{1-a^2(x_3)} & \text{for } x_3 \in \mathbb{R}. \end{cases} \quad \text{with } a_0 \in (0, 1),$$

We set

$$U(x) = (x_1, x_2, -x_1x_2 + v(x_3)) ,$$

where  $v$  is chosen in such a way that

$$\begin{cases} (bv')' - 2a = 0, & x_3 \in \mathbb{R}, \\ v(x_3) = 0, & x_3 < 0. \end{cases}$$

It turns out that  $v' > 0$  for  $x_3 > 0$  and consequently

$$\det DU = \begin{cases} v' > 0, & \text{for } x_3 > 0, \\ v' = 0, & \text{for } x_3 \leq 0. \end{cases}$$

$U$  maps  $\{x_3 \leq 0\}$  into the surface

$$\{x_3 = -x_1x_2\} .$$

The end.

THANKS!
